

Leave The ROCK In The Mine

Fairchild F330 Continuous Miner

SELECTIVE MINING ON THE FIRST SWING

Fairchild mining systems are the only ones in the world that mine coal selectively by cutting and loading low-ash coal on the first swing. Without resetting the miner, you're able to cut and load rock coal on the second swing, as

well as handle the high-ash and high-sulfur varieties. Our selective mining capabilities also make it possible for you to mine more seams profitably because preparation can start at the face.

By getting less rock in the raw coal, you'll have less dust so your preparation plants can operate more efficiently while making coal mining more environmentally friendly.

Because our design is center-placed, you get true wethead shears, leaving room for air to sweep across the face and dilute dust or methane. The result is lower out-of-seam dilutions under the harshest conditions, which reduce your maintenance costs.

To avoid cutting rock, come to Fairchild.

For more information on our continuous miners, haulage systems, scoops and maintenance vehicles, call us at 540-726-2380, e-mail sales@fairchildint.com or visit www.fairchildint.com

COAL PREPARATION BEGINS AT THE MINE FACE

The Fairchild Model F330 Continuous Miner leaves rock in the mine, greatly reducing harmful silica dust. At Fairchild International, we're committed to improving health and safety in our nation's coal mines.
